### Abstract

Detailed surveys were carried out from two districts viz. Poonch and Sudhnoti of Kashmir Valley during summer seasons of 2007 and 2008 to make an updated record of inhabiting Odonata. Ten localities were selected on the basis of variables keeping in view the habitat requirements of Odonata. The present study provides a record of 16 Anisopterous species spreading to 9 genera and 29 Zygopterous species spreading to 14 genera. Among these *Lestes patricia* is a new record for the country. The distribution, synonymy, richness and abundance of the species are discussed in this paper. The Kashmir Valley is rich in insect biodiversity, the odonate fauna of this valley needs to be further explored.

**Keywords:** Odonata, Poonch, Sudhnoti, Kashmir Valley.

### Introduction

The Kashmir valley is the liberated part of State of Jammu and Kashmir. It lies between longitude 73° – 75° and latitude of 33° – 36° and is spread over an area of 13,297 Km<sup>2</sup>. The topography is mostly hilly and mountainous along with valleys and plains. Climate is highland subtropical. Districts Poonch & Sudhnoti are mostly mountainous and lie at the foot hills of Himalayas. District Poonch has an area of 855

Km<sup>2</sup>, however Sudhnoti is spread over 569 Km<sup>2</sup> (IPAK, 2008).

Odonates are important predator of serious pests in terrestrial and aquatic ecosystem. They consume noxious flies, mosquitoes, aphids, jassids, bollworms (Fraser, 1933) and black flies (Subramanian, 2005). They are good indicator of the condition of aquatic and terrestrial ecosystems (Brown

1991). Odonata themselves may also be significant prey items of birds, fishes and some other invertebrates such as spiders and predatory coleopterans (Kapoor, 1985).

Previously, Laidlaw (1915) and Fraser (1933-34) reported odonata from subcontinent, Kanth (1985), Khaliq (1990), Khaliq *et al.* (1994), Ali (1995), Yousuf *et al.* (2000) studied Odonata of different districts of Kashmir valley. Khaliq and Siddique (1995), Khaliq *et al.* (1990) and Khaliq *et al.* (1995) studied the odonates of Poonch district of Kashmir Valley. However, during the year 1995, Poonch was divided into two individual parts i.e Poonch and Sudhnoti. No significant work has been done on the odonate fauna of the area after partition. It is important to know the existing fauna of both the districts individually. The area has greater biodiversity and is rich in water resources. In view to this, it was planned to extensively explore the Odonata of Poonch and Sudhnoti to make an updated and authentic record.

## Materials and Methods

Five sites (Fig.1.) were selected each from the district Poonch and Sudhnoti of Kashmir Valley. The sites were selected on the basis of variables which may be important according to Clark and Samway (1996) in influencing the distribution of adult Odonata. Among Poonch [Datot (L1), Hajira (L2), Rawalakot (L3), Banjosa (L4), Abbaspur (L5)] and Sudhnoti [Tattapani (L6), Palandri (L7), Azad Pattan (L8), Goraha (L9) and Tararkhal (L10)] were surveyed during the summer season of two consecutive years (2006 & 2007).

Methods of sampling were based on Wahizatul-Afzan *et al.* (2006) with minor additions. The collected specimens were brought to Odonata section at National Insect

Museum, Islamabad – Pakistan. The preservation methodology was based on Borror & White (1970). All the collected specimens were identified by running them through taxonomic keys. The taxonomic literature by Fraser (1933 - 1934), Khaliq (1990) and Subramanian (2005) were followed. Voucher specimens have been deposited in National Insect Museum, NARC – Islamabad.

## Results

The study provides a record of 45 species of Odonata including, 16 Anisopterous species identified under 9 genera and 3 families (Table 1) and 29 Zygopterous species identified under 14 genera and 8 families (Table 2). Among Anisoptera, (*Trithemis pallidinervis*) is first time recorded from Poonch district. However in Zygoptera (*Lestes patricia* and *L. viridulus*) are first time reported from both the districts. Among these, *Lestes patricia* (Zygoptera) is a new record for country's Zygopterous fauna. Richness of species (Fig. 2) was observed, which shows that 45 species of Odonata were recorded from district Poonch. However from Sudhnoti, 37 species were collected. Abundance of species (Fig. 3) was also taken into consideration, showing *Orthetrum triangulare triangulare* (Anisoptera), *Agriocnemis pygmaea* (Zygoptera) as one of the most common, abundant and widely distributed species of the area, recorded from seven and nine localities respectively. Amongst Anisoptera (*Anax nigrolineatus*) and Zygoptera (*Ceriatagrion cerinorubellum*) appear to be less common or even rare and were recorded from single locality only. Due to lot of topographic diversity and aquatic habitats, further surveys can unhide more species of Odonata from these areas.
